

Sun.store Super Admin CMS

Welcome! This guide shows how to access the Super Admin CMS (Central platform) and what to do on your first login.

Quick links

Use case	URL
Storefront (Production)	<link href="https://frontend-orcin-seven-95.vercel.app">https://frontend-orcin-seven-95.vercel.app
Storefront (Preview)	<link href="https://frontend-prprx8f2r-ryzenadvanceds-projects.vercel.app">https://frontend-prprx8f2r-ryzenadvanceds-projects.vercel.app
Super Admin CMS (Production)	<link href="https://frontend-orcin-seven-95.vercel.app/central/login">https://frontend-orcin-seven-95.vercel.app/central/login
Super Admin CMS (Preview)	<link href="https://frontend-prprx8f2r-ryzenadvanceds-projects.vercel.app/central/login">https://frontend-prprx8f2r-ryzenadvanceds-projects.vercel.app/central/login

Login steps (Super Admin CMS)

- 1) Open the Central login page: <https://frontend-orcin-seven-95.vercel.app/central/login> (or the Preview link if you are testing).
- 2) Enter your platform username and password, then press “Sign in”. You will be redirected to the dashboard.
- 3) If you see a login error on Vercel: the Super Admin CMS requires the backend API to be reachable. The storefront can run in preview/mock mode, but the CMS login needs the backend in order to issue a token.

Where credentials come from

On a full-stack deployment (backend + database), the first Super Admin account is created by the backend bootstrap variables:

`SUPER_ADMIN_BOOTSTRAP_USERNAME` and `SUPER_ADMIN_BOOTSTRAP_PASSWORD`

Development default: if those variables are empty and the backend is running in development mode, it auto-creates a default master Super Admin account.

Initial master Super Admin login

If the backend is running with `APP_ENV=development` and you did not set `SUPER_ADMIN_BOOTSTRAP_USERNAME/SUPER_ADMIN_BOOTSTRAP_PASSWORD`, the

initial master Super Admin credentials are:

Username: admin

Password: changeme123

Important: this default exists for development/testing only. For production, set bootstrap credentials explicitly and rotate them immediately after first login.

First actions after login

After you reach the Central dashboard, typical first steps are:

- Create a new Store (site): choose slug, template, and owner credentials.
- Review Products: see cross-store product listing and per-site catalogs.
- Review Orders: monitor payments and statuses; demo mode is supported.
- Configure Email: set platform-level SMTP/Gmail and optionally override per site.
- Set custom domain instructions for the store owner (if used).

Troubleshooting

Common fixes:

- Login page loads but sign-in fails: confirm the backend API is up and reachable from the frontend.
- Storefront shows products but CMS is empty: storefront can use embedded preview data; CMS needs backend.
- Forgot password: rotate by updating the super admin account in the database or re-bootstrap on a fresh DB.
- Payments: set `TBANK_MODE=demo` for safe testing; use sandbox/live only with real credentials.

Security notes

- Change any default credentials immediately (especially admin/changeme123).
- Use HTTPS for production, and restrict admin/CMS access where possible.
- Do not commit real secrets into the repo; store them in your deployment environment.

Need help? Share the URL you are using and what error you see on login, and we can pinpoint whether it is API reachability, credentials, or environment configuration.
